

## **Magrathea Telecom NTS API Portal Appendix**

This document is an additional appendix to the 'Number Translation Service' API documentation and should be read in conjunction with the main Numbering API Instructions document.

### ***Number Portal (accessed via MAGIC Platform)***

There are only a few functional differences between using the NTSAPI and the Portal, these are highlighted below:

#### Single Number Activations

When using the Portal you can select from the list of presented numbers, or use the lookup tool to find a number you want. Selecting a number here performs the ALLO and ACTI commands in one for you.

#### Block Activations

When using the NTSAPI you can select any quantity of numbers to search for but in the portal you are restricted to a maximum of 20 numbers in a block.

When you SET a target on a block it will set the same target on every number in the block, if you want a different target on any individual number you will need to do a separate SET on just that number for it to be updated.

NB. If you use the number itself as part of the target then this number will increment for each entry in the block (e.g. the target will correspond with the number).

For example, a block of two numbers starting at 08715045378, if the target is entered as S:[08715045378@mydomain.com](mailto:08715045378@mydomain.com) then the result will that the numbers are SET as:

S:[08715045378@mydomain.com](mailto:08715045378@mydomain.com)

S:[08715045379@mydomain.com](mailto:08715045379@mydomain.com)

#### Check status of numbers

When using the NTSAPI you would use the STAT command to check the current status of a number. In this portal you can simple use the SET/VIEW button to return the current settings and to SET new ones.

*Please note that the portal currently only supports the management of UK numbers, including ported.*
