
Mag-Net

This product enables you to produce your own call handling solutions without the need to operate any telephony servers of your own. The only requirement to use this product is that you will need to have an HTTPS server facing the public internet. This allows complex call control systems to be designed by you, without needing anything more advanced than a webserver and a basic scripting language like PHP.

The product is implemented with a RESTful structure using the HTTPS protocol.

Why choose Magrathea for this service?

- Our pricing is competitive
- All calls will stay on the Magrathea network- minimising points of failure
- Minimal hardware requirement for you
- Easy to add new features over time on customer demand, such as IVR systems and call routing features
- No need for you to handle a single call yourselves, our network will take care of the telephony
- Our technology is developed in-house, drawing on industry standards for ultimate carrier grade reliability

How it works

Calls generated on the PSTN network will be delivered to Magrathea's network via our high-quality resilient interconnects. On arrival a HTTPS PUT transaction will be delivered to your server to generate a call object. A number of parameters will be delivered at this time, which will include a unique call reference, together with data such as the dialled number and caller ID. This will ensure all calls stay on the Magrathea network, which will in turn minimise points of failure.

Charges

There is no setup fee for this service however we reserve the right to charge for support should you require consultancy to utilise this service. No monthly charges will apply if you already take an inbound service with a minimum of £100 invoice.

Normal numbering charges will apply.
